Heat Stress Prevention

RISK CONTROL

As spring turns into summer and brings up "hot weather," we should all be aware of some tips to prevent heat stress. Remember, physical activity at high temperatures can directly affect health and indirectly be the cause of accidents.

What is Heat Stress?

It's a signal that says the body is having difficulty maintaining its narrow temperature range. The heart pumps faster, blood is diverted from internal organs to the skin, breathing rate increases, and sweating increases, all in an attempt to transfer more heat to the outside air and cool the skin by the evaporation of sweat. If the body can't keep up, then the person suffers effects ranging from heat cramps to heat exhaustion, and finally to heat stroke.

Dry clothes and skin doesn't mean you're not sweating!

In dry climates you might not feel wet or sticky, but you are still sweating. On a very warm day you can lose as much as two liters of fluid.

Beat the heat. Help prevent the ill effects of heat stress by:

- Drinking water frequently and moderately (about a glassful every 15-30 minutes). Due to the fact that most of us already consume excess salt in our diets, salt tablets are not recommended for general use.
- Resting frequently.
- Eating lightly.
- Doing more strenuous jobs during the cooler morning hours.
- Utilizing ventilation or fans in enclosed areas.
- Remembering that it takes about 1-2 weeks for the body to adjust to the heat; this adaptation is quickly lost – so your body will need time to adjust after a vacation, too.
- Avoiding alcohol consumption. Many cases have occurred the day after a "night on the town."
- Wearing light-colored, cotton clothes and keeping your shirt on – desert nomads don't wear all those clothes for nothing.
